

# Package: sf2 (via r-universe)

May 5, 2026

**Type** Package

**Title** Spatial Analysis tools

**Version** 0.1.6

**Description** sf2 extends the function of sf package.

**License** GPL-3

**LazyData** TRUE

**import** RoxygenNote: 6.1.0

**Imports** magrittr, stringr, purrr, terra, sf, tidymodels, rlang,  
data.table, dplyr, graphics, methods

**Suggests** testthat (>= 2.1.0), igraph, exactextractr, sp, knitr,  
rmarkdown, covr

**VignetteBuilder** knitr

**RoxygenNote** 7.3.2

**Roxygen** list(markdown = TRUE)

**Encoding** UTF-8

**Depends** R (>= 3.6)

**Config/pak/sysreqs** libabsl-dev cmake libgdal-dev gdal-bin libgeos-dev libicu-dev libssl-dev libproj-  
dev libsqlite3-dev libudunits2-dev

**Repository** <https://rpkgs.r-universe.dev>

**Date/Publication** 2025-09-07 12:13:20 UTC

**RemoteUrl** <https://github.com/rpkgs/sf2>

**RemoteRef** HEAD

**RemoteSha** 2088240ee34486b52ad8fd5506a525b26e76a16a

**Index** **11**

---

get\_RegionalMean      *get\_RegionalMean*

---

**Description**

get\_RegionalMean

**Usage**

get\_RegionalMean(f, shp = sf2::bou1\_4p)

get\_RegionalMeans(fs, shp = sf2::bou1\_4p)

---

guess\_network      *guess\_network*

---

**Description**

guess\_network

**Usage**

guess\_network(info)

**Arguments**

info:            the first two columns should be [i, contains]

**References**

<https://stackoverflow.com/questions/25130462/get-disjoint-sets-from-a-list-in-r>

**Examples**

```
## Not run:  
info = shp_contains(shp)  
l_net = guess_network(info)  
  
## End(Not run)
```

---

load\_data

*load\_data*

---

**Description**

load\_data

**Usage**

load\_china\_river()

load\_china()

load\_continent()

**Details**

- [load\\_china\\_river](#)
- river*\$i*: river polylines
- river\_p*\$i*: river polygons
- 
- 

---

make\_grid

*make\_grid*

---

**Description**

construct SpatialGridDataFrame

**Usage**

```

make_grid(
  range = c(-180, 180, -90, 90),
  cellsize = 1,
  midgrid = c(TRUE, TRUE),
  prj = NULL,
  type = "base",
  fix_lon360 = FALSE
)

get_grid.lonlat(lon, lat, fix_lon360 = FALSE)

fix_lon(x)

```

**Arguments**

|            |  |
|------------|--|
| range      | A numeric vector, [lon_min, lon_max, lat_min, lat_max]   |
| cellsize   | Numeric vector, grid cell size [cellsize_lon, cellsize_lat].   |
| midgrid    | A vector, [midgrid_lon, midgrid_lat]. If midgrid = false, then begin point and end point locate on grid lines; If true, then begin point and end point in the middle of grid.  |
| prj        | <a href="#">sp::CRS-class()</a> Projection.  |
| type       | Character, one of mat or vec. <ul style="list-style-type: none"> <li>• base: If image(x) looks correct, x can be put into grid directly: <code>grid@data &lt;- data.frame(x = as.numeric(x))</code></li> <li>• gdal: If image(x) looks correct, x needs to flipud: <code>grid@data &lt;- data.frame(x = as.numeric(Ipaper::flipud(x)))</code> In version <math>\geq 0.1.3</math>, <code>c("mat", "vec")</code> was renamed as <code>c("base", "gdal")</code>.</li> </ul> |
| fix_lon360 | boolean  |

**Details**

The input matrix suits for image, can be directly input to make\_grid.

**Examples**

```

range <- c(73, 105, 25, 40) # Tibetan Plateau
grid <- make_grid(range, cellsize = 1 / 2, midgrid = TRUE)

```

---

|           |                  |
|-----------|------------------|
| make_rast | <i>make_rast</i> |
|-----------|------------------|

---

**Description**

make\_rast

**Usage**

```
make_rast(
  range = c(-180, 180, -90, 90),
  cellsize = 1,
  nlyrs = 1,
  vals = NULL,
  ...
)
```

**Arguments**

|          |  |
|----------|--|
| range    | A numeric vector, [lon_min, lon_max, lat_min, lat_max]                 |
| cellsize | Numeric vector, grid cell size [cellsize_lon, cellsize_lat].           |
| nlyrs    | positive integer. Number of layers                                     |
| ...      | other parameters to <a href="#">terra::rast()</a> , e.g., names, vals. |

**See Also**

[terra::rast\(\)](#)

---

|                  |                         |
|------------------|-------------------------|
| overlap_fraction | <i>overlap_fraction</i> |
|------------------|-------------------------|

---

**Description**

overlap\_fraction

**Usage**

```
overlap_fraction(shp, cellsize = 0.1, range = NULL, outfile = NULL, ...)
```

**Value**

- I : the order of base, [lon, lat], image works directly on it.
- cell: the order of gdal, [lon, rev(lat)], returned by values(r),

## Examples

```
## Not run:
library(nctools)

f = "//kong-nas/CMIP6/DATA/China/CN0.5.1_ChinaDaily_025x025/yearly/CN05.1_Tmax_1961_2021_yearly_025x025.nc"

data = ncread(f, "tmax")
image(data[, , 1]) # should works

r = rast(f)
range = as.vector(ext(r))
cellsize = res(r)

## End(Not run)

# shp = basin_Baihe
load_china()
shp = bou1_4p
cellsize <- 0.5
range <- st_range(shp, cellsize)

dat = overlap_fraction(shp, cellsize = cellsize, range, outfile = NULL)
print(dat)
```

---

rast\_df

*rast\_coord*

---

## Description

rast\_coord

## Usage

```
rast_df(r, .area = TRUE, na.rm = FALSE)
```

## Value

- I : the order of base, [lon, lat], image works directly on it.
- cell: the order of gdal, [lon, rev(lat)], returned by values(r),

---

|             |                    |
|-------------|--------------------|
| rdist.earth | <i>rdist.earth</i> |
|-------------|--------------------|

---

**Description**

rdist.earth

**Usage**

rdist.earth(x1, x2 = NULL)

**Arguments**

|    |  |
|----|--|
| x1 | A position matrix [lat, lon], degree unit. |
| x2 | same as x1                                 |

---

|                   |   |
|-------------------|---|
| select.SpatRaster | <i>Select layers from a SpatRaster object</i> |
|-------------------|---|

---

**Description**

This function allows you to select specific layers from a SpatRaster object using tidyverse-style syntax similar to dplyr's select. Supports selection by name, position, and tidyselect helpers.

**Usage**

```
## S3 method for class 'SpatRaster'
select(.data, ...)
```

**Arguments**

|       |  |
|-------|--|
| .data | A SpatRaster object containing multiple layers   |
| ...   | Expressions for selecting layers. You can use: <ul style="list-style-type: none"> <li>• Layer names: <code>select(r, layer1, layer2)</code></li> <li>• Numeric indices: <code>select(r, 1, 3)</code></li> <li>• Negative selection: <code>select(r, -layer1)</code> (exclude layer1)</li> <li>• tidyselect helpers: <code>select(r, starts_with("temp"))</code></li> </ul> |

**Value**

A SpatRaster object containing only the selected layers

**Examples**

```
## Not run:
library(terra)
r <- rast(c("elevation.tif", "slope.tif", "aspect.tif"))

# Select by name
r_elev <- select(r, elevation)

# Select multiple layers
r_sub <- select(r, elevation, slope)

# Exclude layers with negative selection
r_no_aspect <- select(r, -aspect)

# Use tidyselect helpers
r_s <- select(r, starts_with("s"))

## End(Not run)
```

---

|         |                       |
|---------|-----------------------|
| st_clip | <i>clip shapefile</i> |
|---------|-----------------------|

---

**Description**

clip shapefile

**Usage**

```
st_clip(x, y)
```

---

|             |                    |
|-------------|--------------------|
| st_dissolve | <i>st_dissolve</i> |
|-------------|--------------------|

---

**Description**

st\_dissolve

**Usage**

```
st_dissolve(x, by = NULL, ...)

## S3 method for class 'sf'
st_dissolve(x, by = NULL, ...)

## S3 method for class 'character'
st_dissolve(x, by = NULL, ...)
```

---

|              |                     |
|--------------|---------------------|
| st_extractId | <i>st_extractId</i> |
|--------------|---------------------|

---

### Description

st\_extractId

### Usage

```
st_extractId(x, y, plot = TRUE, ...)
```

### Arguments

|      |   |
|------|---|
| x    | A sf point, or file path                        |
| y    | A sf polygon, or file path                      |
| plot | Boolean. Whether to visualize extracted points? |
| ...  | others passed to <code>sf::st_within()</code>   |

---

|          |                               |
|----------|-------------------------------|
| st_range | <i>get range of sf object</i> |
|----------|-------------------------------|

---

### Description

get range of sf object

### Usage

```
st_range(x, cellsize = 0.1)
```

### Arguments

|          |           |
|----------|-----------|
| x        | sf object |
| cellsize | double    |

---

|         |                |
|---------|----------------|
| st_rect | <i>st_rect</i> |
|---------|----------------|

---

**Description**

st\_rect

**Usage**

```
st_rect(range, crs = st_crs(4326))
```

**Arguments**

range                    [lon\_min, lon\_max, lat\_min, lat\_max]

**Examples**

```
## Not run:
xlim <- c(112, 115)
ylim <- c(21, 23)
range <- c(xlim, ylim)
poly <- st_rect(range)
write_sf(poly, "poly.shp")

## End(Not run)
```

---

|           |                                      |
|-----------|--------------------------------------|
| write_shp | <i>write and read ESRI Shapefile</i> |
|-----------|--------------------------------------|

---

**Description**

write and read ESRI Shapefile

**Usage**

```
write_shp(x, file, ...)
```

**Arguments**

x                        Spatial\* Object from sp package  
file                      The path of ESRI shapefile  
...                       other parameters to [sf::write\\_sf\(\)](#)
